

Special Issue on Advances in Dementia

Call for Papers

Dementia is a broad category of brain diseases that cause long term loss of the ability to think, reason and remember clearly. The most common form of dementia is Alzheimer's disease (75%) and most types of dementia are slow and progressive. Although cognitive testing, laboratory tests and imaging can help to diagnosis of dementia and cholinesterase inhibitors are often used in the early stage of disease, except for some treatable types, there is still no cure. More seriously, according to statistics, the number of dementia worldwide in 2010 was estimated at 35.6 million. As more and more people suffer from **dementia** and have nothing significantly effective to do, further study on **dementia** has become necessary and meaningful to researchers.

In this special issue, we intend to invite front-line researchers and authors to submit original researches and review articles on exploring **advances in dementia**. Potential topics include, but are not limited to:

- Signs and symptoms of dementia
- Pathology of dementia
- Epidemiology of dementia
- Diagnosis and prevention measures
- Alzheimer's disease and other brain diseases
- Cognitive impairment
- Cases of dementia

Authors should read over the journal's [Authors' Guidelines](#) carefully before submission. Prospective authors should submit an electronic copy of their complete manuscript through the journal's [Paper Submission System](#).

Please kindly notice that the “**Special Issue**” under your manuscript title is supposed to be specified and the research field “**Special Issue - Advances in Dementia**” should be chosen during your submission.

According to the following timetable:

Manuscript Due	September 25th, 2014
Publication Date	November 2014
